Student ID: 10245

Class: 9B

Total Score	Max Score	Percentage
7.18	9	79.8%

Question 1 — 3 / 3

Semantic coverage of required concepts: 87%. Answer fully matches the expected concepts.

Suggested stronger answer: Photosynthesis is the process by which plants convert light energy into chemical energy. It uses carbon dioxide and water as inputs and produces glucose and oxygen as outputs. It occurs mainly in the chloroplasts.

Confidence: 94% | Semantic similarity: 91%

Question 2 — 2 / 2

Semantic coverage of required concepts: 88%. Answer fully matches the expected concepts.

Suggested stronger answer: Mitosis is the process of cell division that produces two genetically identical daughter cells from a single parent cell. It is used for growth and tissue repair.

Confidence: 94% | Semantic similarity: 90%

Question 3 — 2.18 / 4

Semantic coverage of required concepts: 74%. A statement contradicting the official answer was detected.

Contradiction flagged — a statement conflicting with the official answer was detected; please review manually.

Suggested stronger answer: The cell membrane is a phospholipid bilayer that surrounds the cell. It controls what enters and exits the cell, providing selective permeability. It also contains proteins that assist in transport and cell signaling.

Confidence: 87% | Semantic similarity: 71%
